

Here is a set of photos and some pre-written code.

Your goal is to create a slideshow & preview thumbnail.

// GOALS:

0) YOU SHOULD ONLY SHOW 1 PHOTO AT A TIME /1

1) When the user clicks the "Prev" button, the current slide should slide out of view to the right and the previous slide should slide into view /2

2) When the user clicks the "Next" button, the current slide should slide out of view to the left and the next slide should slide into view /2

3) The slide show should be on an endless rotation  
e.g. When the carousel is on the last slide, the first slide should slide into view if the user clicks the "Next" button while on the last slide /2

4) When the carousel is on the first slide, the last slide should slide into view if the user clicks the "Prev" button /2

5) Create thumbnails (mini-pictures) in the `<div class="pagers" id="pagers"></div>` .  
(the small thumbnails should be below the large image) should be dynamically generated/created by JavaScript.  
/4

5a) You can generate these from the large images located inside the "slides" element or use the "th-star-wars..." images located in the images folder

5b) The pager images should trigger their corresponding image to slide into view when it is clicked on.

For Example:

If you click on the thumbnail for "fs-star-wars-03.jpg" then the "fs-star-wars-03.jpg" should slide into view.

6) Write comments in your JS with `/* */` that explains the purpose of your functions and what section does.  
/4

7) Make the website look more aesthetically pleasing
